

Industrial Robotics Telemetry & Performance Dashboard

This project presents a comprehensive industrial analytics dashboard focused on robotic operations and mechanical telemetry. It consolidates task execution data, operational status, and performance indicators to provide a clear overview of how an industrial robotic system behaves in production. Key metrics such as total tasks, average task duration, error rate, task status distribution, and execution time by task type enable fast identification of bottlenecks and performance differences across processes and robot models.

In addition, the dashboard integrates mechanical and temporal data such as speed, acceleration, and joint torque readings, allowing deeper analysis of robot behavior over time. The solution is connected to a MySQL database, supporting near real-time monitoring and demonstrating a professional data modeling approach suitable for industrial analytics, automation, and mechatronics use cases. This project highlights practical skills in data modeling, Power BI visualization, and end-to-end monitoring of industrial systems.
